

VIII. Mini Project - College Placement Analytics

AIM:

To clean, process, analyze, and visualize college placement data using Python, and develop simple dashboards using Power BI and Tableau to identify placement trends based on department, CGPA, internship experience, and salary.

DOMAIN:

Education Analytics / Placement Analytics

PROBLEM STATEMENT:

College placement data contains information about students' academic performance, technical skills, internship experience, placement status, and salary packages. Analysing this data manually can make it difficult to identify placement trends and compare student outcomes across departments. There is a need for a simple data-driven visualization system to analyze placement performance and derive meaningful insights.

OUTPUT:

Python:

College Placement Analytics

PowerBi:

Tableau:

Result:

Thus, the College Placement Analytics project was successfully developed and executed using Python, Power BI, and Tableau to clean, analyze, and visualize college placement data and identify placement trends based on department, CGPA, internship experience, and salary.
